Use OpenNMT-py library to design a machine translation (MT) system using the transformer architecture. Use the same dataset as the previous lab assignment.

Design an neural machine translation model on the training data and evaluate it on the test data. Use BLEU metric for translation evaluation. Use https://github.com/mjpost/sacrebleu for computing BLEU. Provide bin wise BLEU scores. Report your bin-wise result analysis.

Use two types of embeddings for the words/subwords.

1) FastText Embeddings: https://fasttext.cc/docs/en/pretrained-vectors.html
2) Subword Embeddings: https://github.com/bheinzerling/bpemb
    a) Before using the subword embedding, first you need to encode the text into subwords. Follow the above GitHub repository for the same.
